Supported By:

NXDomain Request

NXDomain Attack

RANDOM DNS Request Flood

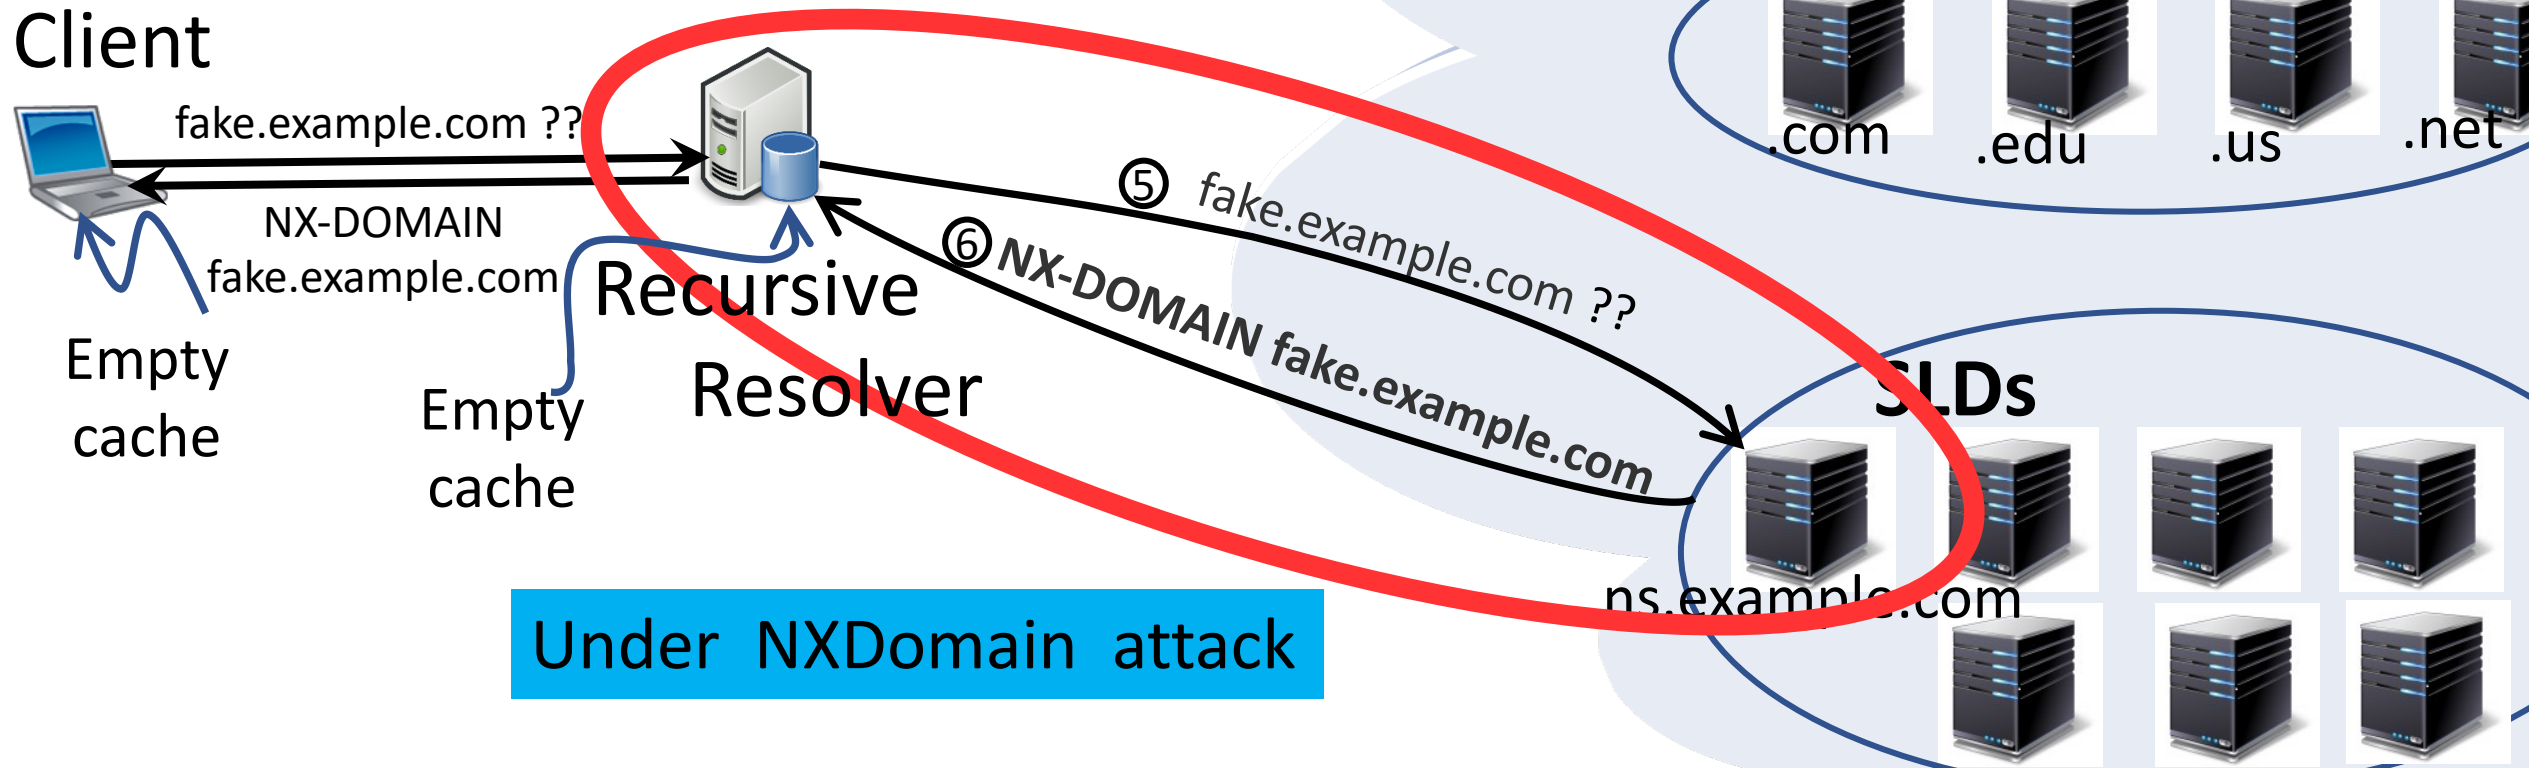

Resolvers

With DNSSEC

	Max Queries Per Second
Plain DNS	23,524
DNSSEC: NSEC	9,510
DNSSEC: NSEC3	8,989

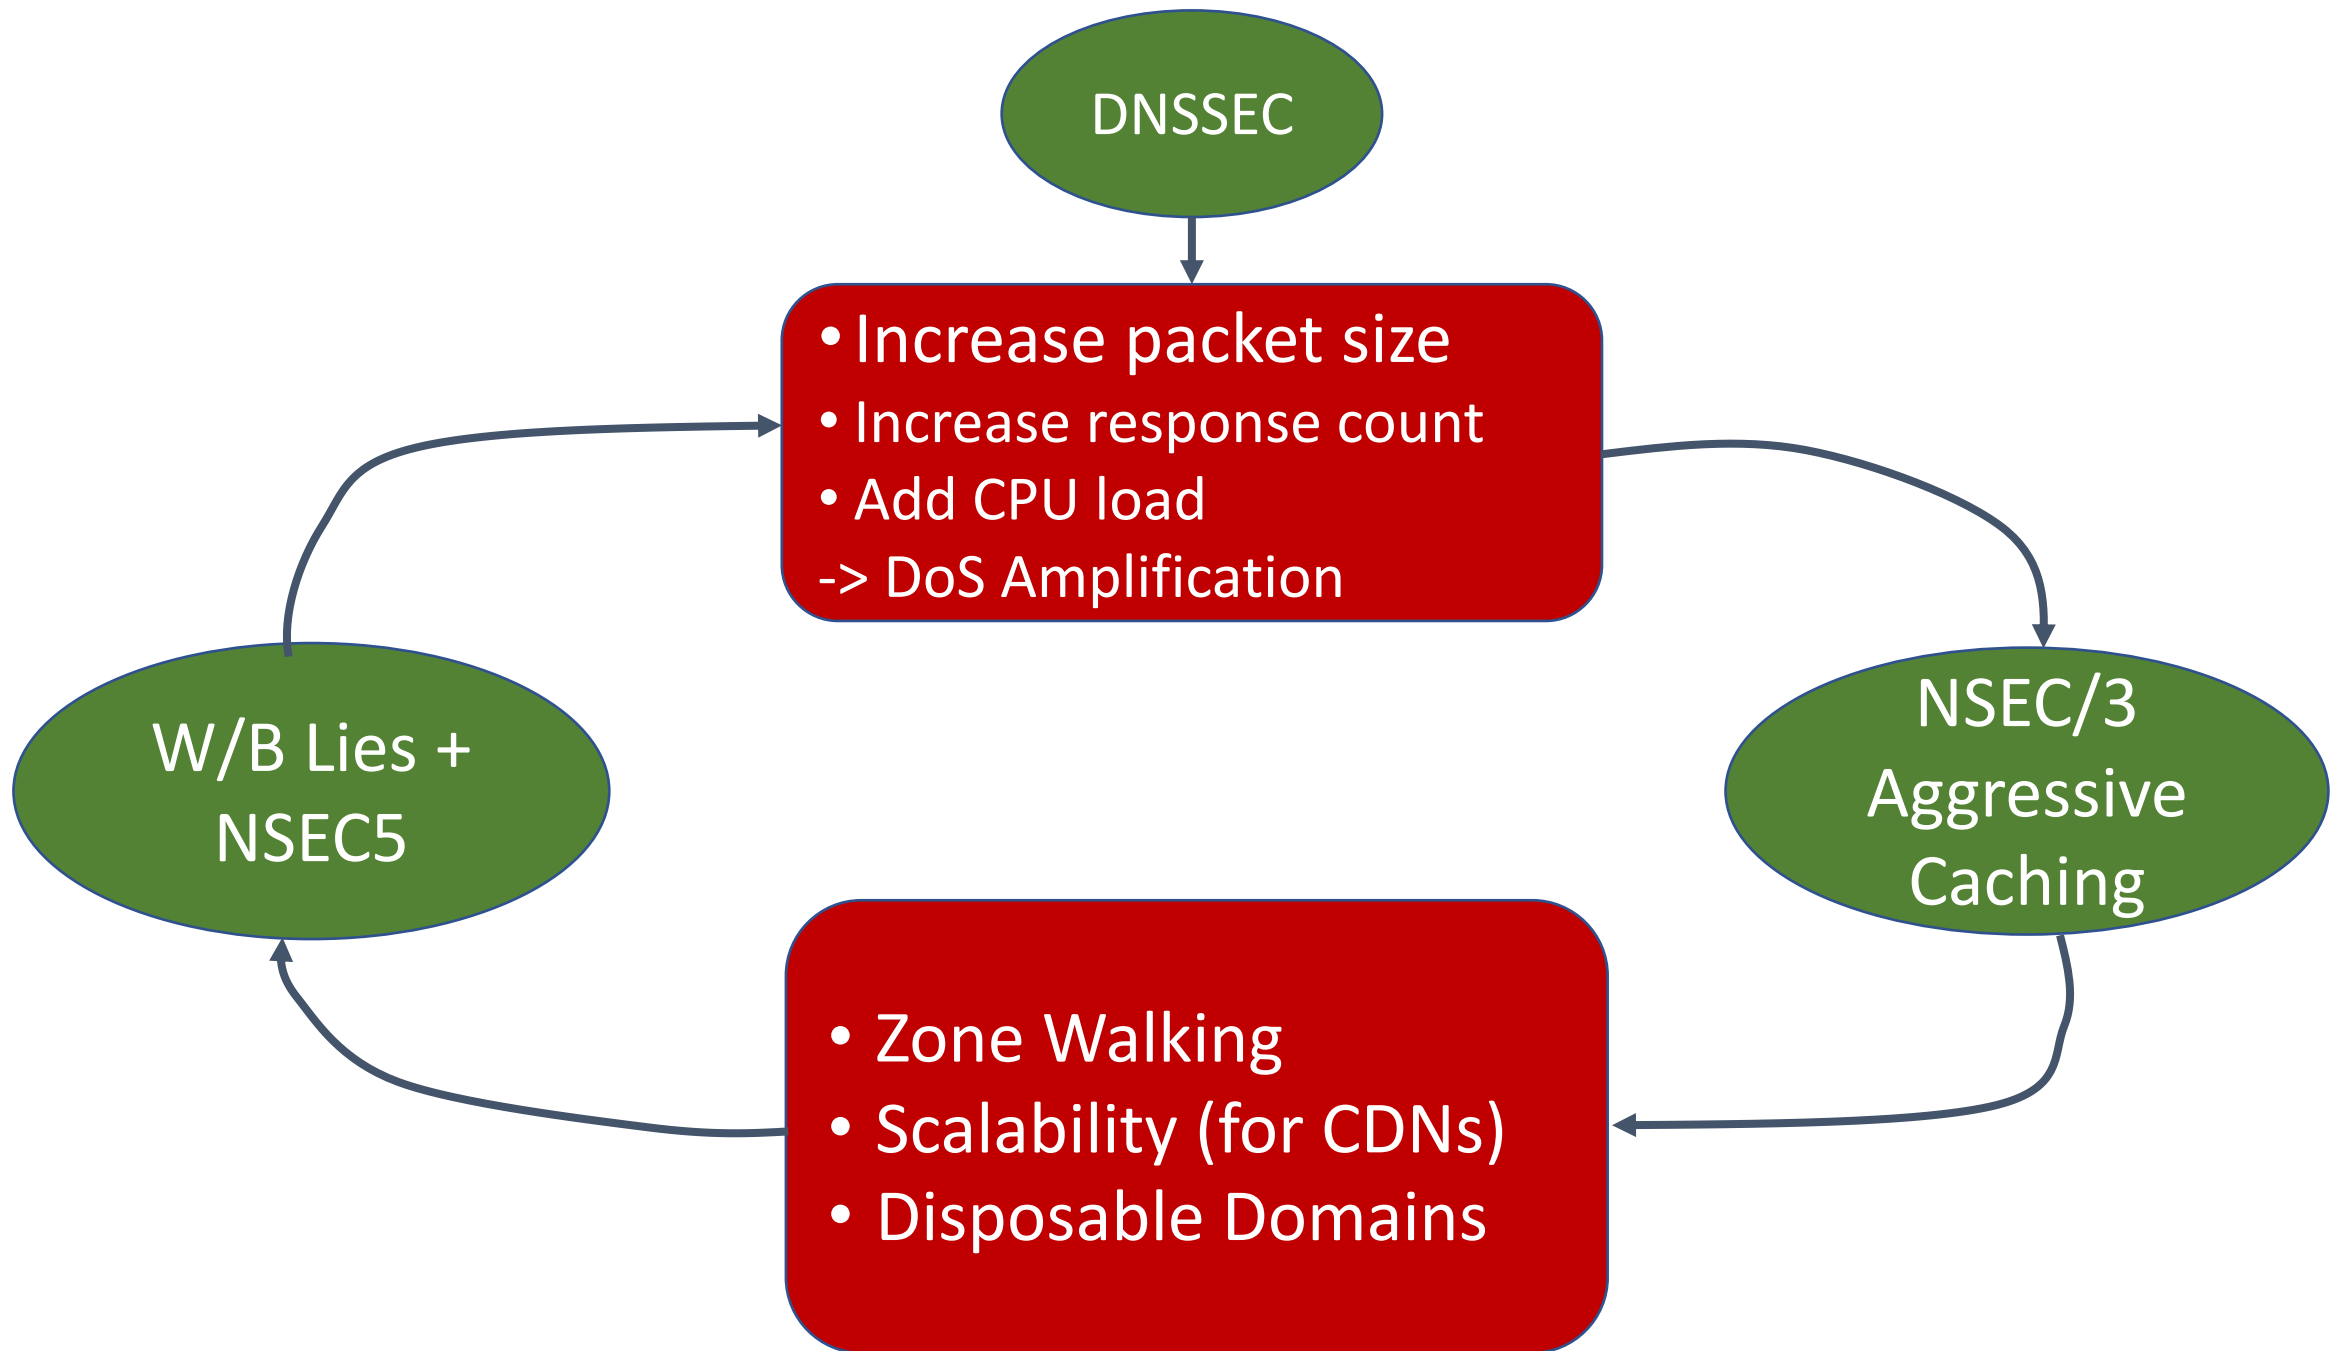

Motivation

- DNSSEC is important
- DNS with DNSSEC does not scale, specifically,
 ➔ Vulnerable to NXDomain flood attacks

Goal

1. To measure DNSSEC scalability relative to Plain DNS
2. Develop a method for <resolver \leftrightarrow authoritative> collaboration that is
(a) Scalable, (b) as secure as DNSSEC, and (c) introduces no new vulnerabilities.
 - a. Provides the same security level as DNSSEC, and
 - b. Provides performances close to that of Plain-DNS, and
 - c. Does not enable new vulnerabilities.

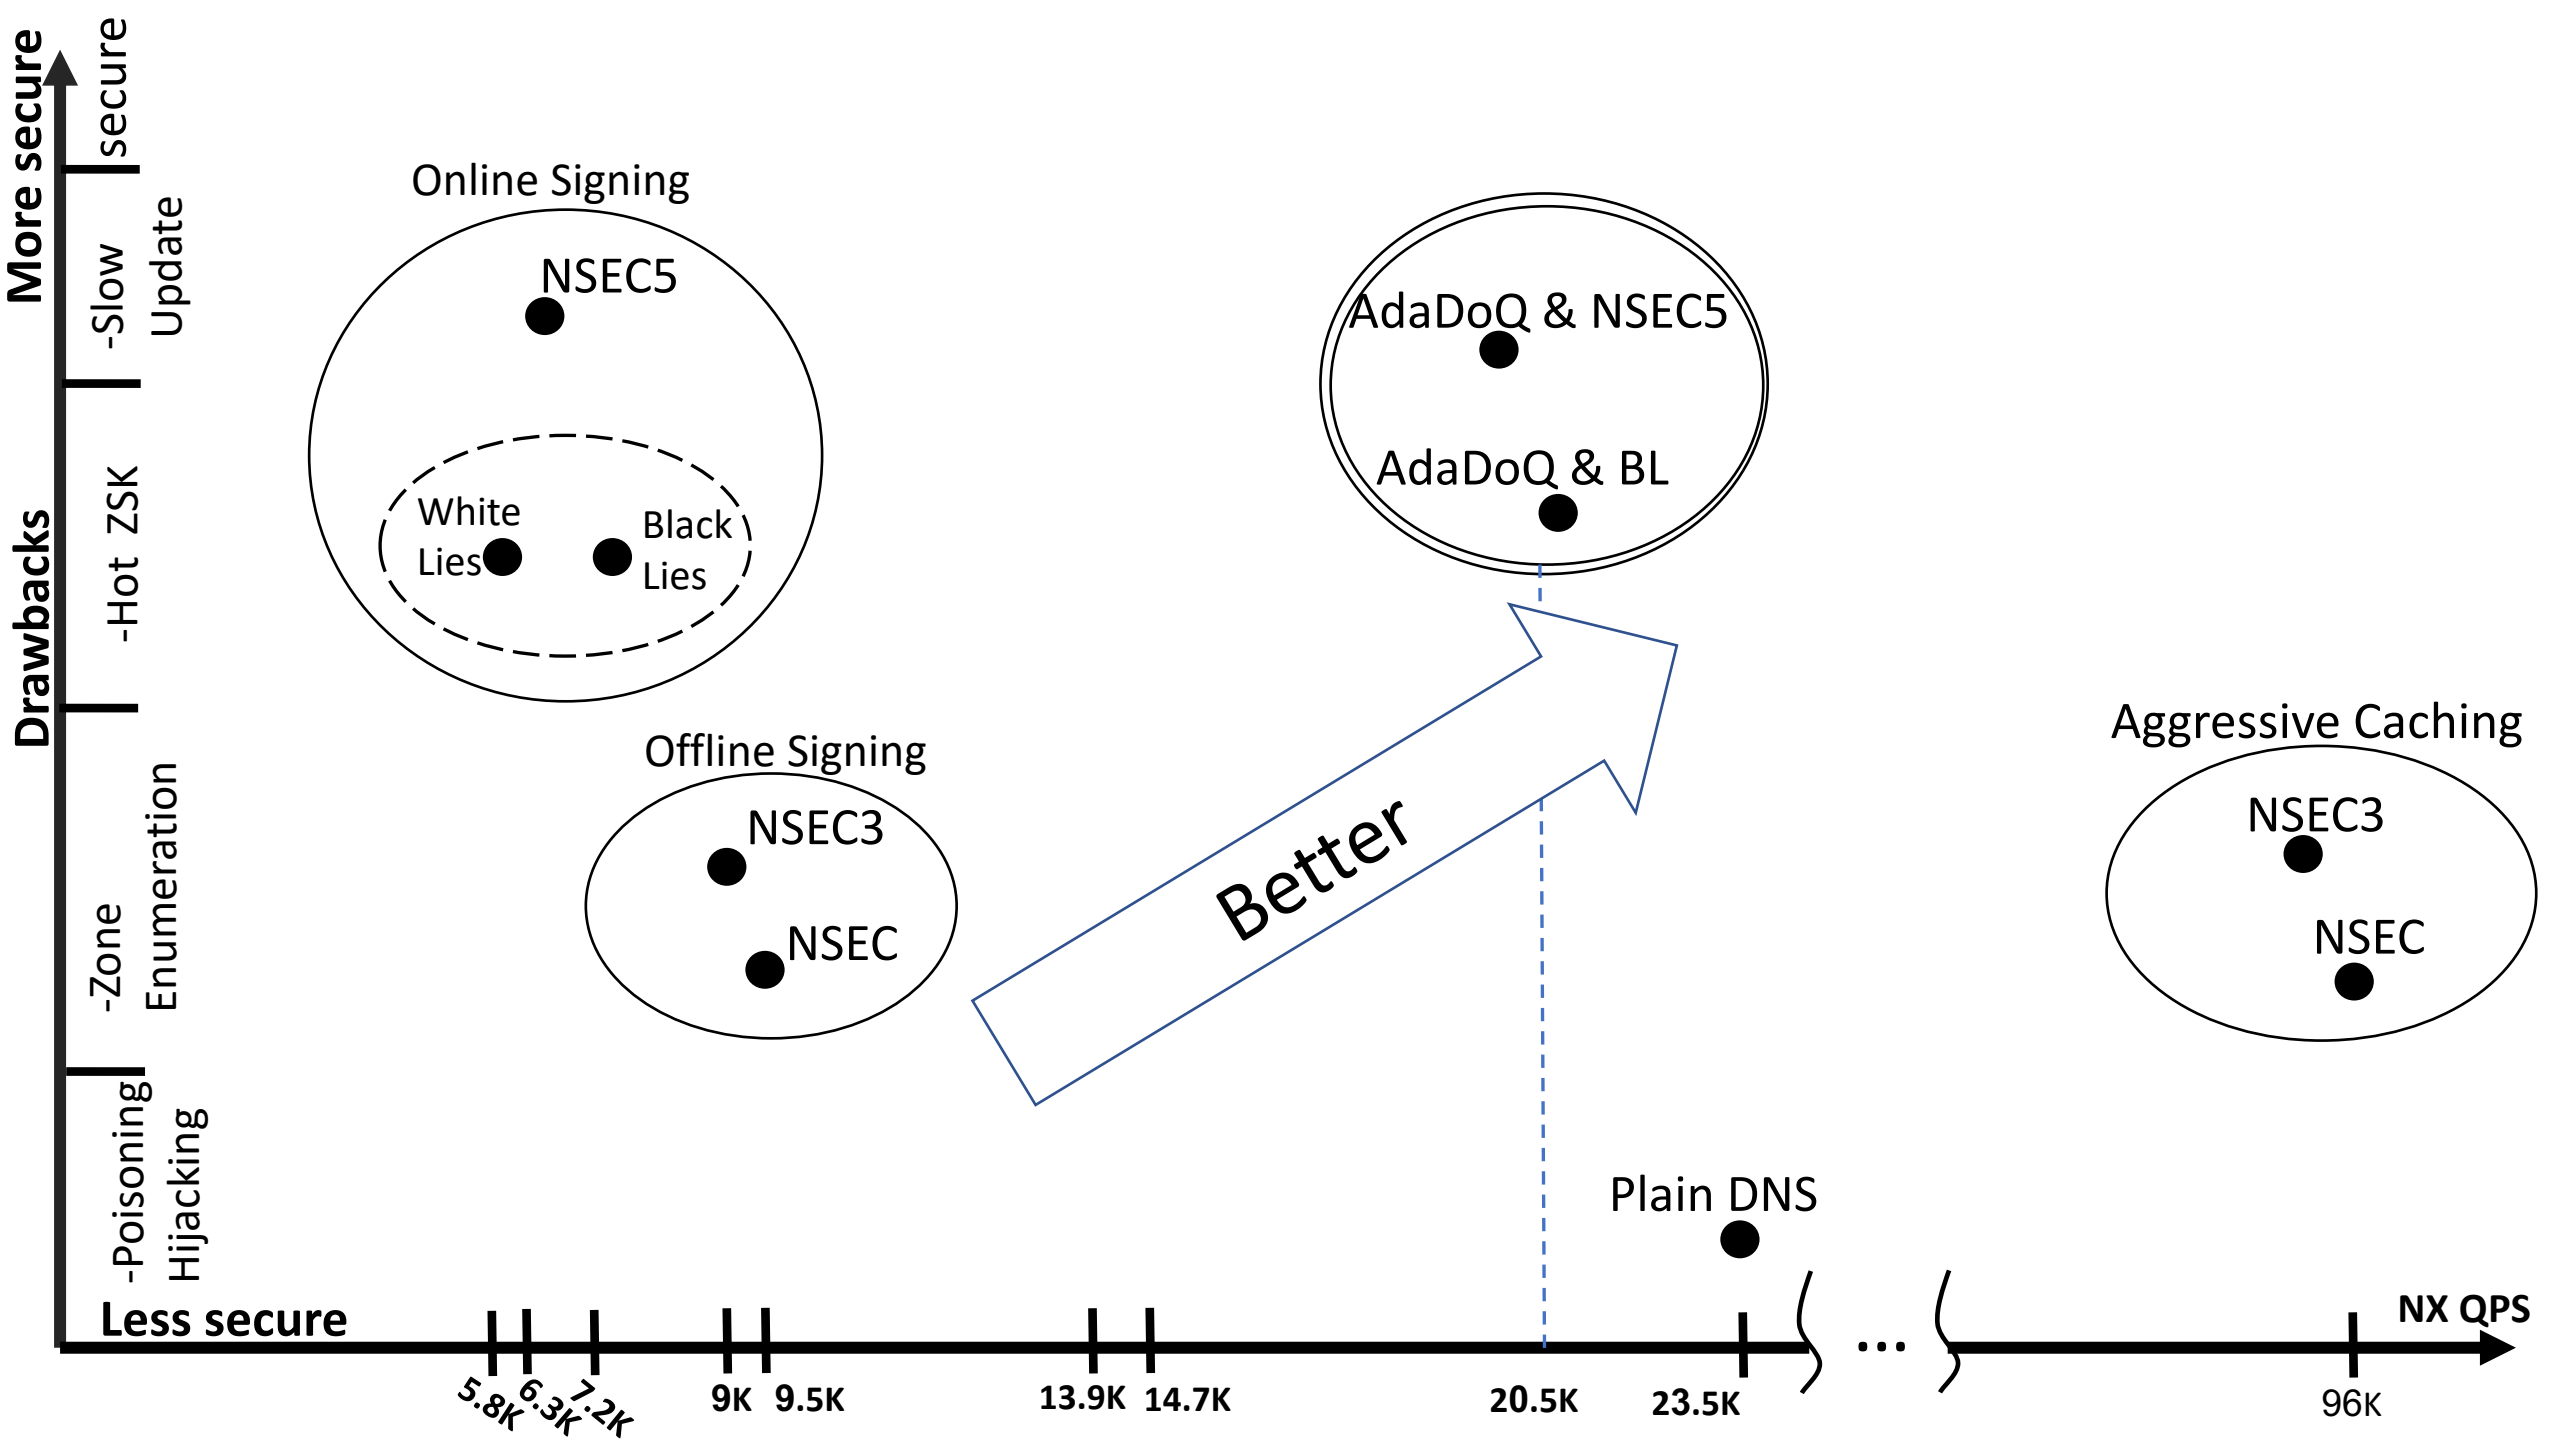

DNSSEC

- Increase packet size
 - Increase response count
 - Add CPU load
- > DoS Amplification

NSEC/3
Aggressive
Caching

- Zone Walking
- Scalability (for CDNs)
- Disposable Domains

W/B Lies +
NSEC5

Conclusions

- DNSSEC degrades DNS performance
 - Make NXDOMAIN attacks worse (DDoS amplification)
- AdaDoQ – Hybrid Solution
 - Light and fast connections
 - One time encryption overheads
 - Close to Plain DNS throughput
 - No Security Compromises
 - No Zone Walking
 - No Scalability Issues
